

QUESTION	ANSWER
----------	--------

## Quiz Cards: Chemical Changes

### How to use the quiz cards to learn the key facts

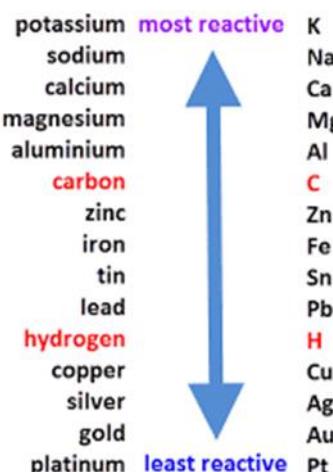

- 1) Take 6 quiz cards at a time and read through them
- 2) Cover up the answer side of the page.

Question	Answer
----------	--------

- 3) Take the first quiz card and ask yourself the question. Either write the answer down or say it out loud.
- 4) Check your answer using the answer side of the card.
- 5) Do this question again until you get it right.
- 6) Repeat the process for the second question.
- 7) Before going onto the third question repeat question one and two.
- 8) When you have gone through all of the questions try and do them in a random order to really test your knowledge.

### ONCE YOU HAVE LEARNT THEM ALL ....

- 9) Complete some exam questions to apply your knowledge.
- 10) Check your answer with the mark scheme and correct any errors in green pen.
- 11) Repeat steps 9-10 until you get the answers correct all of the time.

QUESTION	ANSWER																																													
<p><b>List</b> the order of the reactivity series and <b>what</b> element is the most and least reactive?</p>	 <table border="0"> <tr><td>potassium</td><td><b>most reactive</b></td><td>K</td></tr> <tr><td>sodium</td><td></td><td>Na</td></tr> <tr><td>calcium</td><td></td><td>Ca</td></tr> <tr><td>magnesium</td><td></td><td>Mg</td></tr> <tr><td>aluminium</td><td></td><td>Al</td></tr> <tr><td><b>carbon</b></td><td></td><td>C</td></tr> <tr><td>zinc</td><td></td><td>Zn</td></tr> <tr><td>iron</td><td></td><td>Fe</td></tr> <tr><td>tin</td><td></td><td>Sn</td></tr> <tr><td>lead</td><td></td><td>Pb</td></tr> <tr><td><b>hydrogen</b></td><td></td><td>H</td></tr> <tr><td>copper</td><td></td><td>Cu</td></tr> <tr><td>silver</td><td></td><td>Ag</td></tr> <tr><td>gold</td><td></td><td>Au</td></tr> <tr><td><b>platinum</b></td><td><b>least reactive</b></td><td>Pt</td></tr> </table> <ul style="list-style-type: none"> <li>• Potassium is the most reactive.</li> <li>• Platinum is the least reactive.</li> </ul>	potassium	<b>most reactive</b>	K	sodium		Na	calcium		Ca	magnesium		Mg	aluminium		Al	<b>carbon</b>		C	zinc		Zn	iron		Fe	tin		Sn	lead		Pb	<b>hydrogen</b>		H	copper		Cu	silver		Ag	gold		Au	<b>platinum</b>	<b>least reactive</b>	Pt
potassium	<b>most reactive</b>	K																																												
sodium		Na																																												
calcium		Ca																																												
magnesium		Mg																																												
aluminium		Al																																												
<b>carbon</b>		C																																												
zinc		Zn																																												
iron		Fe																																												
tin		Sn																																												
lead		Pb																																												
<b>hydrogen</b>		H																																												
copper		Cu																																												
silver		Ag																																												
gold		Au																																												
<b>platinum</b>	<b>least reactive</b>	Pt																																												
<p><b>Why</b> can the metals below carbon in the reactivity series be extracted from their oxides using carbon?</p>	<ul style="list-style-type: none"> <li>• Carbon is more reactive than all of the metals below it in the reactivity series.</li> <li>• Carbon will displace these less reactive metals from their oxides by the process of reduction.</li> <li>• Metal Oxide + <math>\text{C} \rightarrow</math> Metal + Carbon Dioxide</li> <li>• The metal oxide and carbon must be heated.</li> </ul>																																													
<p><b>Why</b> cannot the metals above carbon in the reactivity series be extracted from their oxides using carbon?</p>	<ul style="list-style-type: none"> <li>• Carbon is less reactive than all of the metals above it in the reactivity series.</li> <li>• Carbon will not displace these more reactive metals even when heated.</li> <li>• The metals above carbon can be extracted from their oxides by electrolysis.</li> </ul>																																													

QUESTION	ANSWER
<b>What</b> is a reduction reaction?	<ul style="list-style-type: none"> <li>• The removal of oxygen from a compound.</li> </ul>
<b>What</b> is a oxidisation reaction?	<ul style="list-style-type: none"> <li>• The gaining of oxygen in a compound.</li> </ul>
<b>What</b> is a redox reaction?	<ul style="list-style-type: none"> <li>• A chemical reaction where both reduction and oxidisation occur.</li> </ul>
<b>What</b> is a native metal?	An unreactive metal that is naturally found in the earth as its own element. (it is not an ore).
<b>What</b> is an acid?	<ul style="list-style-type: none"> <li>• Produce <math>\text{H}^+</math> ions when added to water.</li> <li>• Has a pH between 0-6.</li> </ul>
<b>What</b> colour do acids universal indicator?	Red-orange-yellow

QUESTION	ANSWER
<b>What</b> is an alkali?	<ul style="list-style-type: none"> <li>• A soluble base (dissolves in water)</li> <li>• Produce OH- ions when added to water</li> <li>• Has a pH of between 8-14.</li> </ul>
<b>What</b> colour do acids universal indicator?	Blue - purple
<b>What</b> is a base?	<ul style="list-style-type: none"> <li>• A substance that neutralises an acid.</li> <li>• E.g metal oxide or metal hydroxide</li> </ul>
<b>What</b> does the symbol (aq) mean?	Aqueous (dissolved in water).
<b>What</b> does the symbol (s) mean?	Solid
<b>What</b> does the symbol (l) mean?	Liquid

QUESTION	ANSWER
<b>What</b> does the symbol (g) mean?	Gas
<b>What</b> is an indicator?	Something that has a different colour in acids and alkalis.
<b>What</b> does the term “strong” mean?	The acid or alkali is fully ionised in water.
<b>What</b> does the term “weak” mean?	The acid or alkali is partially ionised in water.
<b>What</b> substance would have a pH of 2?	Strong acid (red)
<b>What</b> substance would have a pH of 7?	Neutral (green)

QUESTION	ANSWER
<b>What</b> substance would have a pH of 12?	Strong alkali (purple)
<b>What</b> is <u>neutralisation</u> ?	A reaction between an acid and an alkali or base that results in a solution that is neutral (pH7).
<b>What</b> happens to the pH of an acid when an alkaline is added?	It increases towards a pH of 7.
<b>What</b> happens to the pH of an alkali when an acid is added?	It decreases towards a pH of 7.
<b>What</b> is the neutralisation word equation?	Acid + Base $\rightarrow$ Salt + Water
<b>How</b> do you form crystals from a neutralisation reaction?	Heat with a Bunsen and evaporate off the water.

QUESTION	ANSWER
<b>What</b> does the term “soluble salt” mean?	A salt that is dissolved in water (is aq).
<b>What</b> does the term “insoluble salt” mean?	A salt that is NOT dissolved in water (is solid).
<b>What</b> happens to the ions during a neutralisation reaction?	. $\text{H}^+(\text{aq}) + \text{OH}^-(\text{aq}) \rightarrow \text{H}_2\text{O}(\text{l})$
<b>How</b> do you make soluble salts?	a) metals: Acid + Metal $\rightarrow$ Salt + Hydrogen b) metal oxide: Acid + Metal oxide $\rightarrow$ Salt + water c) hydroxides: Acid + Hydroxide $\rightarrow$ Salt + water d) metal carbonates: $\text{Acid} + \text{Metal Carbonate} \rightarrow \text{Salt} + \text{Water} + \text{Carbon Dioxide}$
<b>When</b> acid reacts with metal <b>what</b> do you get?	Salt + Hydrogen
<b>How</b> do you form insoluble salts?	Mix two solutions to form a precipitate.

QUESTION	ANSWER
<b>What</b> is a use for precipitation reactions?	Removing metal ions from waste water.
<b>How</b> do you make salts from an insoluble base?	Add the base to the acid until no more will react. Filter to remove excess. Crystallise the salt solution
<b>How</b> do you make salts from an acid and alkali?	mix acid and alkali solutions; use indicator to show when have completely reacted to produce a salt solution; crystallise solution to produce solid salt.
<b>What</b> salt does hydrochloric acid form?	..... Chloride
<b>What</b> salt does Nitric acid form?	..... Nitrates
<b>What</b> salt does Sulphuric acid form?	..... Sulphates

QUESTION	ANSWER
<b>What</b> do you get if you react an acid with a metal?	Acid + Metal $\rightarrow$ Salt + Hydrogen
<b>What</b> is oxidation?	Oxidation is the loss of electrons and happens to the non metal ion: $2\text{Cl}^- \rightarrow \text{Cl}_2 + 2\text{e}^-$
<b>What</b> is reduction	Reduction is the gain of electrons and happens to the metal ion $\text{Mg}^{2+} + 2\text{e}^- \rightarrow \text{Mg}$
<b>What</b> is electrolysis?	Electrolysis breaks down a substance using electricity. The substance being electrolysed is called the <u>electrolyte</u> .
<b>Why</b> can ionic compounds only be electrolysed when molten or in solution?	Their ions are <b>free</b> to move to the electrodes.
<b>Where</b> do positive ions move to?	The negative electrode (the cathode)

QUESTION	ANSWER
<b>Where</b> do negative ions move to?	The positive electrode (the anode).
<b>What</b> happens to the ions at the electrodes?	Ions are discharged at the electrodes producing elements.  At the electrodes, negative ions lose electrons (they are <b>oxidised</b> ) and positive ions gain electrons (they are <b>reduced</b> )
<b>Represent</b> the reactions at the electrodes with half equations.	$2\text{Cl}^- \rightarrow \text{Cl}_2 + 2\text{e}^-$ $\text{Na}^+ + \text{e}^- \rightarrow \text{Na}$  OR: $2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$ $4\text{OH}^- \rightarrow \text{O}_2 + 2\text{H}_2\text{O} + 4\text{e}^-$ $4\text{OH}^- - 4\text{e}^- \rightarrow \text{O}_2 + 2\text{H}_2\text{O}$
<b>What</b> ion is made at the at the cathode?	Metal ion  But ... Hydrogen if the metal is more reactive than hydrogen.
<b>What</b> ion is made at the at the anode?	Non-metal ion  But ... Oxygen unless the solution contains halide ions when the halogen is produced.
<b>What</b> are the uses of electrolysis?	Extract metals if they are too reactive to be extracted by reduction with carbon or if the metal reacts with carbon.

QUESTION	ANSWER
<b>What</b> is the main disadvantage of using electrolysis?	Large amounts of energy are used in the extraction process to melt the compounds and to produce the electrical current.
<b>How</b> is Aluminum extracted from it's ore?	Molten aluminium oxide is electrolysed in to make aluminium metal. First the aluminium oxide is mixed with cryolite to lower its melting point. A carbon anode is used.  The positive carbon electrode is replaced regularly as it reacts with the oxygen to form carbon dioxide.  Aluminium forms at negative electrode. $\text{Al}^{3+} + 3\text{e}^- \rightarrow \text{Al}$  Oxygen forms at positive electrode. $2\text{O}^{2-} \rightarrow \text{O}_2 + 4\text{e}^-$
<b>What</b> do we produce when we electrolyse brine (salty water)?	We produce three products- <b>chlorine gas, hydrogen gas and sodium hydroxide solution</b> (an alkali)
